                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptides. Compositions comprising the lung tumour polypeptides, polypeptides, fusion proteins, antibodies to the polypeptides, T cell populations, or antigen presenting cells that express the lung tumour polypeptides, are useful for treating lung cancer or stimulating an immune response. The polymucleotides and polypeptides are also useful in the diagnosis and monitoring of lung cancer. Sequences ABK15889-AAS16343 represent CDNA molecules encoding the polypeptides of the invention and PCR primers used to amplify the CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GACTITICCTACTIGGCAGIACAICIACGIAITAGICAICGCIAITACCAIGGIGAIGCGG 337

The method involves introducing a restriction enzyme and a nucleic acid regulatory sequence into mammalian cells - for integrating the nucleic acid construct into the mammalian cell genome at sites generated by the restriction enzyme. Mutant mammalian cells having a trait of interest can then be selected. The method of the invention is useful for isolating a gene controlling a trait of interest from a mammalian cell. The method is useful for discovering and isolating new genes. The method of the invention can be used to create large libraries of mammalian cells which have a low transfection efficiency. The method of the invention is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            335 gacitirectactificacagracarcracgrafragicardectarraccardergardegg 394

A method has been developed of increasing prostanoid production in vivo comprising delivering and hyperexpressing a prostaglandin synthase gene in cells. The method can be used for gene therapy. The method is useful for the treatment of diseases such as pulmonary embolus, myocardial infarction and general lung disease (e.g. adult respiratory distress syndrome). Generally the present invention provides a plasmid comprising a cytomegalovirus (GWV) derived promoter sequence driving the coding region for ovinine prostaglandin G/H synthase (PGH). In order to increase translation augmenting sequence and a portion of the 3' untranslated region from the human growth hormone (HGH) gene. The present sequence region from the human growth hormone (HGH) gene. The present sequence regions the computation of the sequence and a portion of the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       551

The stabilizing SQ contains 1 or 2 splice donor-intron-acceptor SQs, esp. from the specified CMV gene, or the intron is from CMV or the Ig variable region, while the splice-acceptor component corresponds to the Ig acceptor SQ. The vector may also include (upstream of the promoter) an enhancer, esp.

Expression vector pF8CSSS contains the cytomegalovirus enhancer and promoter, an engineered stabilising sequence, the cDNA encoding factor VIII and the SV40 polyademylation site. The entire intron region including donor and acceptor sequences was deleted and replaced by an engineered stabilising sequence. pF8CSSS is used in a method for prodn. of a desired heterologous protein in a eukaryotic host cell. The method comprises: transfecting a encaryotic host cell with an expression vector having a sequence of as DNA comprising, an expression vector having a sequence of a do DNA comprising, an expression vector having a sequence of the desired protein, and a polyencoding the anino acid sequence of the desired protein, and a polyencoding the anino acid sequence of the desired protein, and a polyenching the method provides useful quantitities of a desired protein in a relatively short period of time without having to establish continuous prodn. The transient expression system optimises the interaction between specific vector components and certain trans-activating proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammanian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                  CMV enhancer/Myeloproliferative sarcoma virus LTR promoter construct DNA.

                                                                                                                                                                                                                                                                                    Run on:
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AV681509 GKA Homo sapiens cDNA clone GKAAAC02 5', mRNA sequence.
AV681509
Fax: (617) 632-6989
Email: thomas look@dfci.harvard.edu
Email: thomas look@dfci.harvard.edu
The clone was obtained from an R2DD array made from an adult kidney
cDNA random primed library from Leonard Zon. RZPD library number
576. This clone is available from the Resource Centre/Primary
Database of the German Human Genome Project: RZPD (Ressourcen
Sentrum Primr Datenbank). http://www.rzpd.de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       589 GACTTTCCTACTTGGCAGTACATCTACGTATTAGTCATCGCTATTACCATGGTGATGCGG 530

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (13-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:23664519.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs are ordered and oriented, and separated by sized gaps filled with Storm to the consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (24-OCT-2001) Human Genome Sequencing Center, Department Submitted (24-OCT-2001) Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases 1 to 278936) (College of Medicine, One Rat Genome Sequencing Consortium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

Of May 10, 2003 this sequence version replaced gi:23664548.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (Ittp://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Worley, K.C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The rat genome contains two nonallelic genes which are similarly expressed and produce very similar end products for preproinsulin. They differ from each other by two AAs in the B-chain and by two AAs in the Creptide. The coding region of the rat insulin I is sequence contains two intervening sequences, the first of which also found in rat insulin. The homology extends to about 500 nucleotides upstream of the cap sites, but diverge extensively immediately downstream of their poly-A sites.

In a personal communication, S.Chan [4] noted that the 5' end of the sequence in fig. 5 of [2] is incorrect; hence we have only included the bases 3' to this area.

A TATA box is located at positions 909-914, and a poly-A signal at 1980-1985.

Expression vector construct pVGI.1 containing VEGF-2 insert. ABK10062 standard; DNA; 5283 BP. (first entry) WO200211769-A1. 14-FEB-2002. 21-MAY-2002 Synthetic. ABK10062;

```
expression vector construct containing the vacular endothelial growth factor 2 (VEGF-2) insert. The nucleic acid is useful for producing a host cell by transducing, transforming or transfecting a host cell with the DNA and for transforming or transfecting ischaemia or myocardial ischaemia, or a disease or disorder selected from autoimmune disorders (e.g. rheumatoria arthritis, dermatitis), allergic reactions or conditions (e.g. asthma), organ rejection, inflammatory conditions (e.g. crohn's disease), hyperproliferative disorders (e.g. Gaucher's disease), cardiovascular disorders (e.g. cardiowascular disorders (e.g. cardiowascular disorders and embolism. This sequence represents the PVGI-1 expression vector containing the VEGF-2
                                          Isolated nucleic acid having expression vector construct with vascular endothelial growth factor-2 insert, useful for treating chronic limb ischaemia or myocardial ischaemia, autoimmune disorders and allergic
                                                                                                                                                                                                                      invention relates to an isolated nucleic acid comprising pVGI.1
                                                                                                                                                                      Disclosure; Fig 31; 241pp; English.
